# Racial-assignment sensitivity, available 2019

Summary and complete category table. Same fixed full-SJ roster, origin masks, saved income bins and equal or saved annualized matched-visit weights.

## A. Association across the same fixed 136 categories

| Venue weighting | Racial assignment | Spearman correlation | Label minus mixture |
|---|---|---|---|
| Equal venue | Mixture | -0.14 | Reference |
| Equal venue | Plurality: primary | 0.34 | 0.47 to 0.49 |
| Equal venue | Plurality: reverse | 0.34 | 0.47 to 0.49 |
| Annualized matched visits | Mixture | -0.13 | Reference |
| Annualized matched visits | Plurality: primary | 0.15 | 0.27 to 0.29 |
| Annualized matched visits | Plurality: reverse | 0.15 | 0.27 to 0.29 |

All six correlations and all four change intervals are retained. The intervals use released endpoint rounding bins; they are not confidence intervals and have no newly estimated centre. Equal displayed correlations do not establish full-precision equality.

## B. National information-loss diagnostics

| Origin-flow flag | Equal venue | Annualized matched visits |
|---|---|---|
| Exact-maximum tie | 0.0% | 0.0% |
| Largest racial share below one half | 10.8% | 12.2% |
| Largest-to-second-largest share gap at most 5 percentage points | 3.8% | 4.2% |

Each percentage averages within-venue jointly classified origin-flow fractions over the entire SJ roster. These are not pooled origin counts, visitor traits, misclassification rates, error bounds or eligibility screens. Flags overlap: do not add them. The published 0.0% tie values do not mean exact zero; near ties are not merged by the assignment rule.

Plurality discards within-origin racial variation. Four racial groups are compared with ten area-median-income bins. Residential-background measures do not identify personal traits, actual contact, general bias correction, geographical robustness or causal effects.

## C. Complete category means and change intervals

All 150 categories and both weights, in the frozen CSV order. Means are fractionalization x 100, displayed to 0.1 index point. The two interval columns are label minus mixture, also in index points. They use released endpoint rounding bins only.

Equal = equal venue weights; Visits = annualized matched-visit weights. Shown maps to the historical source token shown_pending_review after its later clearance. Withheld maps to withheld_support: all cells stay missing, never zero. The category table is distinct from the fixed-136 correlation family.

| Category | Weight | Income F | Mixture F | Primary F | Reverse F | Primary - mixture interval | Reverse - mixture interval | Status |
|---|---|---|---|---|---|---|---|---|
| All Other Amusement and Recreation Industries | Equal | 74.2 | 45.2 | 19.8 | 19.8 | -25.5 to -25.3 | -25.5 to -25.3 | Shown |

A change interval containing zero does not establish exact zero, equivalence, disappearance or a scientific null. No additional category-level sign labels are supplied. Primary and reverse use opposite exact-maximum tie priorities on the same racial vectors. Source precision and original status tokens are preserved.

Source: the exact seven-surface cleared bundle of 23 October 2026, with bound independent scientific/disclosure decision and coordinator adoption. The historical staging words in original sources are unchanged. This new presentation requires content review and coordinator adoption before shared or public delivery. Full paths and hashes accompany the figure in caption_and_provenance.txt and presentation_manifest.json.
